# BILLY LEAVES THEMSELVES EXPOSED

University of Plymouth Security Information

This is Billy

Billy has a computer, this computer keeps trying to update, Billy always clicks "Remind me later"...

Billy still doesn't update even when "Later" comes but billy doesn't care, Billy just wants to get on with their work...

Billy gets hacked because their computer isn't up to date, Billy loses all the work and data saved on their PC!

Billy is silly, don't be like Billy

DON'T put it off
'Patches' often quite litteraly patch security holes in software, the longer you leave your system unpatched the more vulnerable it becomes.

DON'T use unsupported software
Compainies often stop maintaining old software to put more focus on new products. If youre using out of date software its likely to have many well known vulnerabilities.

DO enable automatic updates
Operating systems and applications often have automatic update functionality. Its a good idea to enable it so you're always up to date.
